Description

We want to synchronize the redmine issues with our internal system.
For this purpose, we need a feature to fetch changed journal entries of an issue.
Editing a journal entry doesn't change the updated_on field of the issue.

Therefore, we would like to have a GET call like:

```
https://domain.com/journals.json?updated_on=%3E%3D2024-03-25T07%3A24%3A03Z
```

Currently, the journals endpoint only supports updates, but no GET requests.
