Description

I just got the dreaded 90% of the filesystem in use and spend some time creating a MySQL query that helps me find the largest attachments.

```
mysql> select attachments.container_id,attachments.filename,sys.format_bytes(attachments.filesize)
,users.login from attachments right join users on attachments.author_id=users.id where container_i
d is not NULL order by filesize desc limit 10;
+--------------+-------------------------------+----------------------------------------+--------
----------+
| container_id | filename                      | sys.format_bytes(attachments.filesize) | login
          |

```

After which I could send out an email asking various users if those attachments are still needed.

Perhaps this might be useful to someone.
