

Redmine - Feature #35439

Option to require 2FA only for users with administration rights

2021-06-22 23:23 - Marius BĂLTEANU

Status:	Closed	Start date:	
Priority:	Normal	Due date:

Target version:	5.0.0		
Resolution:	Fixed		
Description			
<p>#31920 adds the option to enable 2FA only for certain groups when the 2FA setting is set to optional. This is very useful, but it doesn't cover the case when you want to enable 2FA only for administrators. As a best security practice, if you cannot enforce for all users, the administrators should be top priority to secure using 2FA.</p> <p>My proposal is to add a new setting to allow enforcing 2FA only for administrators:</p> <p> 2fa_optional.png What do you think?</p>

Revision 21395 - 2022-02-01 21:17 - Marius BĂLTEANU

Add "required for administrators" option to Two-factor authentication settings that behaves like optional, but will require all users with administration rights to set up two-factor authentication at their next login (#35439).

Revision 21396 - 2022-02-01 21:27 - Marius BĂLTEANU

Add locales (#35439).

+1 I like the idea. It sounds very reasonable.

One thing I would like to mention is that it doesn't take much to remove the tick from the checkbox as an administrator without the other admins taking notice of the change.

Wouldn't it be better to have this setting in the configuration.yml to have more control on who can change it? Another option could be that every administrator gets notified if this option gets disabled.

A notification sounds better to me.

I think also it's the better way to add the option to force for admins.

If only one admin was set-up and he lost this phone. Any option exist to reset this OTP with SSH access ?

I think this general idea of enforcing 2FA for admins only, might a good idea to allow people to simplify this transition.

Right now, a workaround for that would be to create a group with all admin users and force 2fa for this group. With this setting, people would be relieved from having to maintain a separate group for that while still protecting the most important users.

However, I'm thinking whether it wouldn't be more sensible to introduce an additional possible value for Setting.twofa instead of this separate setting (and thus just an additional option in the dropdown)? This could look like this (as a rough sketch):

```
class Setting
  #...
  def self.twofa_required?
    twofa == '2'
  end

  def self.twofa_optional?
    %w[1 3].include? twofa
  end

  def self.twofa_required_for_administrators?
    twofa == '3'
  end
end

class User
  # ...

  def must_activate_twofa?
    return false if twofa_active?

    return true if Setting.twofa_required?
    return true if Setting.twofa_required_for_administrators? && admin?
    return true if Setting.twofa_optional? && groups.any?(&:twofa_required?)

    false
  end
end
```

What do you think?

#10 - 2022-01-27 21:07 - Marius BĂLTEANU

Thank you, Holger!

I totally agree with you, this is way I created this ticket.

Great idea, thank you! I'm going to update the patch.

- File *0001-Option-to-require-2FA-authentication-only-for-users-.patch* added

Here is the updated version, all [tests pass](#). Thanks again Holger for your feedback!

On a related topic, do you know why was added a new local ([label_required_lower](#)) instead of using downcase on the existing one ([label_required](#))?

#12 - 2022-01-28 12:21 - Holger Just

Thank you Marius for taking care of this!

I think the new option should work kind of like "optional, but required for admins". The possibility of to also enforce 2FA for members of specific groups should still be possible with this setting.

Because of that, I proposed to return true in `Setting.twofa_optional?` above. If you don't want to do that, at least the view in `app/views/groups/_form.html.erb` would have to be adapted for the new option (or it may have to in any case, I not entirely sure now)

As for `User#must_activate_twofa?`, I personally like my proposed option better stylistically because I think the rules are much easier to understand rather than having to parse nested boolean algebra. The result should be exactly the same. The original method was borderline okay with just a few rules. But now with the additional ones, I think we should refactor the method.

downcase might work somewhat OK for languages with latin scripts (and even then, in German nouns start with a capital no matter where they are in a sentence, which would not be a problem in this case but might be in others), but that's not something that will work reliably for arbitrary locales.

I agree that the choice of the name for the locale key is a little unfortunate, but it was chosen to resemble the `_plural` keys for example.

I totally miss that from the updated version of the patch, thanks for pointing this out.

Because of that, I proposed to return true in `Setting.twofa_optional?` above. If you don't want to do that, at least the view in `app/views/groups/_form.html.erb` would have to be adapted for the new option (or it may have to in any case, I not entirely sure now)

First option sounds good to me as well.

As for `User#must_activate_twofa?`, I personally like my proposed option better stylistically because I think the rules are much easier to understand rather than having to parse nested boolean algebra. The result should be exactly the same. The original method was borderline okay with just a few rules. But now with the additional ones, I think we should refactor the method.

I've already committed this change as part of [#31920](#).

I'm attaching a new version which should work as expected. The patch adds the option "required for administrators" in the Two-factor authentication dropdown, between optional and required with the following hint: "Setting required for administrators behaves like optional, but will require all users with administration rights to set up two-factor authentication at their next login."

Some screenshots:
options.png

hints.png

Are the translations clear enough? Or is it better "optional, but required for administrators"?

I agree that the choice of the name for the locale key is a little unfortunate, but it was chosen to resemble the `_plural` keys for example.

Thanks Felix for your response, it's clear now.

I think the option name is clear along with the explanatory text below.
