Description

I'm looking to create a project that functions as an internal ticketing system for our technical department. I have all the custom fields set up and everything is fine except one thing. If possible, I would like to be able to have the ability to add a custom field to issues that functions in the same way as "Target Version" where there is a list of values, although if the needed value isn't present, the user can add it by clicking the add icon next to the field.

Thanks for any help.

+1

This will be nice for search too;

I added a custom field text on versions that is "Used as filter" and a custom field versions on issue that is also "Used as filter".
It's possible to search issues on this custom field for Target Version with filter "Target Version's <version_custom_field_name>" and this will be nice to have a filter for "<issue_custom_field_version_name>'s <version_custom_field_name>".

Thanks for your help,
