Description	
<p>It would be nice to allow users that are "administrators" to work as a normal user unless they need to elevate to admin level to fix/alter something (same idea as sudo in linux - I <i>can</i> be admin, but only when I <i>need</i> to be admin).</p> <p>Redmine requires one user / one email. I am one of several Redmine administrators. We like to know which admin did something (not just generic admin login). I don't like to work at admin level all the time (can't see correct workflows, delete stuff when I should not, etc). I cannot create a second work email. I could create another account at admin level using my personal email (for password recovery), but don't want to mix business with personal...</p> <p>Possible implementations:</p> <ol style="list-style-type: none">1. Username append<ul style="list-style-type: none">- username login = normal user mode- username-adm login = same user but at admin level2. Login add'l step<ul style="list-style-type: none">- login as username- check if admin possible for username- popup box "Login with Admin Rights?"3. Other methods?
