Description

We use Redmine to set up a project management website. And now we encounter a problem, maybe the concepts are obscured.

We create a public project P, and user A is not in this project. When user A logs in, he could view project P, which is understandable.

But we find user A can also add issues to project A without any authority.

Is this a bug? Or should we change project P to a private one? Thank you!

History
