Resolution:			

Description

Currently only these variables are supported/documented:

- value => the custom field value
- id => id of the customized object
- project_id => id of the project of the customized object if defined
- project_identifier => identifier of the project of the customized object if defined
- m1, m2... => capture groups matches of the custom field regexp if defined

It would be nice to have another variable to identify the currently logged user.
Either by passing the:

- user id
- the login name
- **the user's API access key**

I would love to receive user's API access key -> The called webservice could use that key to access Redmine!
