Target version:	3.3.0		
Resolution:	Fixed		

Description

For now, in *10-patches.rb* we have a redefinition of method *human_attribute_name*. But default (plain without hierarchy) Redmine style of transliterations are not convenient for some reasons, especially in big projects. So, my proposal is follows: enable ActiveRecord behaviour for finding transliterations path and add in list of search paths custom one from Redmine. Here is a worked snippet of code:

```
def self.human_attribute_name(attr, options = {})
  prepared_attr = attr.to_s.sub(/_id$/, '').sub(/^.+\./, '')

  redmine_default =
    [
      :field_#{name.underscore.gsub('/', '_')}_#{prepared_attr}",
      :field_#{prepared_attr}"
    ]

  if options[:default].present?
    options[:default] = [options[:default]] unless options[:default].is_a? Array
    options[:default].unshift redmine_default
  else
    options[:default] = redmine_default
  end

  super
end
```

In this case we obtain follows chain of search paths:

1. default AR paths (for example: activerecord.attributes.model_name.field_name)
2. default Redmine paths (for example: field_content)
3. user specified paths (specified in *:default* key from *options* attribute)
4. attribute.humanize (from default *human_attribute_name* from ActiveRecord)
