Description

I'd like some way of sending a search of tickets to someone without having to save the search and sending the link to the saved search. Our right hand nav bar is filled with searches and it gets cumbersome to organise them.

So, for a search in a project called "admin" for items with a subjects containing "nagios" I could use a url like:

https://redmine.fishpond.co.nz/projects/admin/issues?search=(subject.nagios.status.open) or something like that.
