Redmine - Feature #5876

Changes to child estimates should trigger journal entries for the parent estimate

Description

With the new 'subtask' feature in Redmine 1.0.0 RC, any existing estimate for an issue is replaced with a rollup of the estimates for the child issues. Some problems arise from this:

1. Journal entries are created for estimate changes to the child issues, but not for the parent issue, which makes historical burnup reporting much more difficult.
2. More importantly, any high-level estimate which once existed for a parent issue is lost once it gains a child issue. This is the only case I know of in the Redmine database where data gets lost without a journal entry.

Selfishly I only care about estimated time, although I assume this also affects the other rollup values: priority, start date and due date.

In other words, to reproduce:
1) Create issue
2) Set estimated time to 100
3) Create subtask
4) Set estimated time for subtask to 44

In the database, note that estimated_hours for the parent issue will have changed, but there is no associated journal entry.
