Redmine - Feature #6385

Issue mailer displays journal entries different from issue_helper.show_details()

2010-09-13 21:02 - Randy Syring

Target version:			
Resolution:			

Description

The issue mailer views just enumerate issue fields whereas the show_details() method is more robust and can be overridden in plugins.

sorry for the static, you can close this issue. I confused the fields for the issue with the fields for the journal. The fields for the journal are using show_details(). The reason I am not getting journal detail entries in my emails is because I am using controller_issues_edit_after_save() instead of ...before_save(), which means my journal detail record isn't added to the journal instance until after the email is sent out.
