Description			
I have many projects that start with the same set of parent & children tasks:			
<ul style="list-style-type: none">• Do This Group Of Things<ul style="list-style-type: none">◦ Setup A◦ Configure A◦ Test A • DO That Group Of Things<ul style="list-style-type: none">◦ Setup B◦ Load B◦ Compile X◦ Test B with X			
Often I will select the parent task (Do this Group Of Things) and all of its children and copy it to a new project.			
When the tasks appear in the new project the parent/child relationship is gone. All of the tasks are there but there is no subtask assigned to the parent. I have to manually go in and edit each child and attach it to the proper task ID # as the parent.

I don't do this (yet) between Projects, but I found that doing a "Duplicate" of a child task doesn't inherit the Parent field value.
