Description <p>I know, the first thing you are going to say is, "just use a VCS [1] repository and hook it into redmine". My use-case for this request is for users of Redmine who are not going to be able to deal with the complexity of a VCS system. I'd like to be able to use a simple web-based file system, like the one currently built into redmine, with a couple of additions. The system doesn't need all the complexities that a full-on VCS requires. Simply keeping a copy of each "upload" of a document/file around and possibly a simple lock/unlock sytem would be <i>amazingly</i> useful. And, hopefully, not overly complex to build.</p> <p>Another solution, although more complex, is to offer some basic integration with the VCS, via the Repository tab. When you click on an individual file, include a link to "upload" (checkin, commit, whatever) a new version of that file. This, i'd imagine, would be more difficult and fraught with unknowns then including a simple (like, <i>really</i> simple) versioning tool for the builtin documents/files modules.</p> <p>Thanks, Jos</p> <p>[1] Version Control System</p>
