Description

I have configured a role that haven't the "view wiki" permission.
When a user that has this role (in all projects) search for some word, redmine fails with this message (bug-in-action.jpg)
If I grant the permission to the role, all works fine.
This is a major bug because normal user can think that the site don't work.

In the log file, I see that the query fails on where condition because "text" field is unknown.

ps: the behavior of redmine in this case is very strange: for example, if I search for *mail* I have an error, but if I search for *mail.* all works fine
