Description It would be good to have integration between Redmine and Balsamiq. Any guidance on that? I don't mind writing one if that is easy enough. I am not a ruby developer so I can't really understand the complexity. I just love Redmine and Balsamiq but I don't want to refer to a Balsamiq permalink in case I want to reference a wireframe in our Documentation in Redmine. Balsamiq has plugins for JIRA, FogBugz but why not for Redmine?			

History

Any ideas here ? I am surprised onbody has an issue integrating Redmine with Balsamiq esp retrieving the history etc.
