Category:	Code cleanup/refactoring	Estimated time:	0.00 hour
Target version:	1.3.2		
<b>Description</b>  The helper perl module to integrate subversion repositories authentication with redmine uses Digest::SHA1. It would be far better to use Digest::SHA, since it's faster and maintained.  Digest::SHA1 has been removed from Debian distributions, for example.  The migration is quite simple, it's enough to rename all Digest::SHA1 to Digest:SHA.
