| Target version: | | | |

Description

This patch provides:

- User authentication based on the Redmine authentication module (including external source, such as LDAP) via the Redmine WebService. The password is ciphered in AES for the communication
- Depending on their role on the project, users can have read/write access or read only access (new permission commit_repositories)
- A fully configurable cache system has been deployed to improve performance (WebServices are quite slow).

History

#1 - 2011-02-08 05:27 - Toshi MARUYAMA

- Category set to SCM

#2 - 2011-03-24 07:28 - Toshi MARUYAMA

- Category changed from SCM to SCM extra
