Redmine - Feature #1061

Subversion per-directory access rights management from RedMine?

Description

I'm using RedMine with more than 10 projects, all with a Subversion repository accessed through SSH. I am trying to enforce some security with svn's path-based access control: each repository has its own authz file like:

```
[groups]
admins = damien, martin, frederic

[/]
@admins = rw
* =
```

These files are actually following redmine's roles organization, so I wondered if it would be possible to let Redmine edit directly this file for each project?

There's a solution for handling svn access right described here that uses apache+mod_dav. But it does not manage per-directory access rights. That's an interesting feature and could be planned as a Redmine plugin.

- Category changed from SCM to SCM extra

#3 - 2012-06-27 15:23 - Christian Jacobs

that would be just great.

Here's a link of my forum entry with a very similar challenge.
