

Redmine - Defect #1066

Per-author commits statistics graph does not like long names

2008-04-15 19:16 - Paul Rivier

Target version:	0.8	Affected version:	
Resolution:	Fixed		
Description I'm monitoring a Mercurial repository with RedMine. In mercurial project, author "name" is usually made of : Joe Doe < joe.doe@domain.com > With long names and long domains, it can easily reach 40 characters overall. In such a situation, there is no space left for per-author commits statistic graph to be printed, so it gets totally unreadable. Naive proposals to solve this problem : <ul style="list-style-type: none">• Truncate name to 10 characters ... ? (I do not think this is a good idea)• Process first the list of authors, and assign a unique number to each of them (1, 2, 3...). Simply putting authors names in an array will give each of them its UID. Then print this UID on the left of the graph, in place of the name, and print a legend below with (UID , real name) pairs. (I like this one better)

And what about displaying **Joe Doe** only (without the email address) ?

And what about displaying Joe Doe only (without the email address) ?

It would, for sure, be an improvement over current behavior. You can assume that anything matching "<.+@.+\.>" can be removed. But it is half a solution, because I work with some people using their full (very long) name, dot separated, as the login. One of them, for example, has a 23-chars long name. Could we assume that any retained solution must render properly up to 30-chars long names ?
Thx

- Category set to SCM
- Status changed from New to Closed
- Target version set to 0.8
- Resolution set to Fixed

SVG graphs are now 800px large ([r1601](#)). This should fix this problem.
