Description	
<p>Is it possible to have a custom field which belongs to multiple type? One situation is that when create one New Issue and need to enter F/W version The F/W version could be a well known released F/W version or a dynamic daily build version For a released F/W version, It could have the type of "List". For a dynamic daily build version, it could be the type of "text"</p> <p>Or if there is an existed feature can resolve this situation, please kindly let me know</p> <p>Thanks</p>

+1

Maybe it's easier to define the field as a Text Field, but with a combobox of predefined values (list, versions, user, ...) to choose from.
The user can choose to select an existing value or enter a new one (entering a new one doesn't change the list of predefined values).
I see also some correlation with #10953
