Description We use some projects like a template to start new client project. With this idea, to start a new project we just copy one of the templates (generic project for the work to do on the client) with the correct name and start to customize this new project. The problem is the owner of the issues, until Redmine 1.3 the owner of the issues of the template was copied to the new project, since 1.4 the owner is the one who copied the project. This two options have their problems. My suggestion is to have a combo in the copy project window , that the user can choose who will be the owner of the issues and etc... of the new project.
