Description			
<p>This request is featured by an real problem i have:</p> <p>Problem</p> <p>I wanted to make the right sidebar menu slide-in, slide-out with jquery (javascript) using redmine themes. The first problem was that themes only can provide one javascript file theme.js, but we need at least two js (jquery min and slider module) to be able to do the job. So i wrote a js which included other js via header.addccild document.write() , which worked so far the js was imported. But first themes js is loaded to late in layouts base.rhtml (first js heads from "core", then plugin's js the themes.js, moreover jquery is not available at right time, mean when i pushed slider behaviour into document by jquery(document).ready() function which i also called in theme.js.</p> <p>No i ended up to <script src="../../../jquery...js> include direct into layouts base.rhtml before js heads and use it by theme.js "jquery(document).ready()" block in my theme.</p> <p>That is not the code separation i aimed, means to pack all into the theme. Furthermore i had to extend layouts base rhtml sidebar div with my slider class handler and onclick tag. This again i couldn't pack into theme, cause there is no html injection or kind of templating possible.</p> <p>Everyone is welcome to show me direction how redmine themes can apply thing better "seperated" without core modification, however sidebar slider works now like a charm</p> <p>I wanna make sidebar menu use accordion with jquery too and top menu stay fixed (when scrolled) with css.</p> <p>I really wanna share this, but as theme package without base.rhtml mod i don't get it done.</p> <p>Solution</p> <p>It works but i need to extend the base.rhtml to include jquery before loading theme.js. If i put the js into theme (where i only can load one js file btw. #11424) it's not available when rendering the sidebar.</p> <p>Furthermore the approach that every plugin can bring its own js is really ugly from architects view. You can get loaded several versions of the same js e.g. jquery lib, and don't know which one's forced at last/first.</p> <p>It would need a redmine (rails?) Javascript Handler core class, where every plugin must register its js libs being used (e.g. in init.rb) with name, version and url. This controller will at least throw error if js already registered with same name or warning if with similar name.</p>
