Description

actually each detected link in ticket-descriptions or other texts will open in the same window and so the open redmine gets lost. by creating xhtml-sites it's not allowed to use the target-tag - i know - but you can use this kind of javascript-pendant i use also for WAI-compatible sites:

```html
<a href="http://www.any-target-domain.tld" onclick="window.open(this.href); return false;" title="external link">www.any-target-domain.tld</a>
```

it would be helpfull if this behavior will be added to redmine.

For open link in new window - it seems the following code should work, but it doesn't in Redmine. The code does work on the following Textile page:

```html
http://textile.thresholdstate.com/
```

```html
<a href="http://ad.com" target="_blank">http://ad.com</a>
```

When I use it in redmine, the notextile tags do not appear, but the `<a href...>` appears inline.

Indeed. Thanks! I've closed #3801.
FWIW: #3801#note-13 (note-13) contains a patch by Filou Centrinov.

See the redmine_open_links_in_new_window plugin, which seems to do a good job at this!

This is a patch to open external links and the help in a new window.

Every browser I can think of has a feature to open links in a new tab and/or window (i.e. Ctrl-Click). Why should we take away the possibility to actually open the link in the same tab / window without gaining anything?

On a side note, if this would be implemented, we could do so without Javascript and just put target="_blank" in the link directly since the target attribute is not deprecated anymore with HTML5.

You can open any normal link in a new window by clicking the middle mouse button (or Ctrl, as mentioned above). This is a logical and usual behavior. I don't see any problem.

Yes, if you remember you can hold down Ctrl or Shift (depending on browser) to get a new tab. But I work with lots of different browsers, and regularly forget to do this (I use a Wacom pen, so middle-mouse is tricky).

I know not everyone wants all external links to open in a new tab, but it would certainly be very welcome as an option here. By it's nature Redmine is a site I want to keep open in a tab forever, and I never want links external to the Redmine to open in the Redmine tab replacing my issue tracker.

I agree that this would be an extremely helpful feature. It's true that I can open links in a new tab by using command-click (or other OS-specific option) but it's extremely annoying every time I forget to do this. I think the ideal solution would be an ability to toggle target="_blank" as a sitewide default in the settings plus an ability to add it to or remove it from individual links via Textile formatting.
Quick answer to a couple of people on this thread - "Why not just use the browser option to open links in new window". The reason is that, ideally, you should be able to implement and maintain as much functionality at the enterprise level as possible. So, adding a setting option to 'open EXTERNAL links in new window' would be very good. If you just want to do that a good plugin is here [https://github.com/lunakid/external_links_in_new_window](https://github.com/lunakid/external_links_in_new_window) which is a fork from an original one that just opened all links in a new window, so that every time you clicked a wiki link it did that.

I didn't know if this had already been solved or added but thought I'd add to this thread as it still seems to be an issue.
