Description

Hi all,

I got a problem while installing "red mine 1.4.4" on shared hosting at "planethoster.net".
I looked everywhere on the web ... but no solution, i really don't understand.

I have SSH access, i get redmine 1.4.4 with mercurial (hg clone ...).
Everything seems to work, but when i enter "RAILS_ENV=production rake db:migrate" in the terminal, here is an error message :

_____

/home/my_username/ruby/gems/gems/activesupport-2.3.14/lib/active_support/inflector.rb:181: [BUG] Segmentation fault
ruby 1.8.7 (2011-02-18 patchlevel 334) [x86_64-linux]

Aborted (core dumped)

_____

And that's all, no db table had been generated and i can't continue to install red mine.

Please help.
Thank's much.
Kevin

patchlevel 334 is too old.
Tests passes on ruby-1.8.7-p358 Redmine 1.4.
