**Description**

Hello,

I'm trying to install a second redmine on my server, and it seems to be a problem. The first redmine installed go slow and show error 500 or 404 on page that work when the second instance application pool is stoped.

So when one redmine is start (application start) it's ok and when the both are started that cause strange issues like don't find pages that existed or site go slower and finaly didn't find the page.

Is there a way to make many instance of redmine works on a server or is it impossible?

Thanks
