Description

2.2.0 Version have brought a nice feature where we can make a preset of our filters.

I have my own project, where I spend most of my time, but also I have a few others, when I can have questions for me as well. I have made a filter preset which shows a task list with specified list of projects, columns. But if I run this preset inside my Project, it only shows the tasks bound to me in this project, even if the saved filter preset contains a few project list to dispaly. If I manually enter to "edit" preset and just press "Apply" it works ok. I have a little workaround, to save a bookmark to this "all project" filter so that it works ok.

the query string inside my project is:
"http://10.0.0.1:81/redmine/projects/supplytasks/issues?query_id=11"
and this way, it only shows issues that are inside "supplytasks" project

but if I run the same query from:
http://10.0.0.1:81/redmine/issues?query_id=11
it work good for me, applying the filter to all the project, where I participate.

Also the thing is, I cant add a "Project" string to filter preset, If I try to save it being inside my project, but I can add this "Project" string If I try to save my preset, from the page "My page" => My tasks "show all tasts" (under the first 10)
