Target version:	
Resolution:	
Description	
<p>Permit a user/group only to view/select a specific git-branch within a project's repository. This would enable the project manager to restrict external stakeholder for example to a release-branch and hide internal (unstable) development branches.</p> <p>The branches available could be selected statically defined in the project settings, eg. "Limit branches to view: yes/no" "Type in the names of the branches, multiple allowed: stable extern"</p>

I would be nice, and even more: to be able to restrict write access per branch.
