Description

Hello,

We follow production versions through tags and commits reachable only from theses tags are not proceed by redmine.

This results in issues not updated when pushing tags.

I think it could be interesting to make the ref sepecs handled by redmine configurable.

People could then adds tags to look for and/or exclude some branches, like personal branches used for development.

Developers could then freely add the "Fixes/Refs/Whatever" in their commits and minimise the risk to forget them without registering in redmine DB short life commits ID in temporary branches (which results in DB inconsistencies c.f. [#12853](#)).

Regards.
