Description			
<p>Hello,</p> <p>We follow production versions through tags and commits reachable only from theses tags are not proceed by redmine.</p> <p>This results in issues not updated when pushing tags.</p> <p>I think it could be interesting to make the ref sepecs handled by redmine configurable.</p> <p>People could then adds tags to look for and/or exclude some branches, like personal branches used for development.</p> <p>Developers could then freely add the "Fixes/Refs/Whatever" in their commits and minimise the risk to forget them without registering in redmine DB short life commits ID in temporary branches (which results in DB inconsistencies c.f. #12853).</p> <p>Regards.</p>
