Description

We keep some sensitive information in project documentation that shouldn't be known by everybody in the project. It would be great to have some method to show this data only to particular users (like admins or managers) with adequate permission and display appropriate substitution otherwise.

For example double !! could mean hidden text: !!some passwords!!. This would be rendered using specific CSS always to show its sensitive text (lighter text for instance) or customizable message otherwise (**, [you need permission], ...).

Our current workaround:

WikiNG provides similar but cumbersome functionality via:

```
{{version < 0}}[you need permison to see this]{{version}}/{{version > 100}}some passwords{{version}}
```

and also provides "View hidden content" permission.

This is very useful option that should be in the main application.
