Description Nice feature would be interesting to consider for Redmine users that are using Redmine in mission critical environments where great difference is if issue is processed in for example 2 hours or in 20 hours. In current configuration, there is no possibility to distinct these issues by using builtin issue filtering. So it would be very useful to have ability to have option for example to filter issues that are created in last X hours (where X is arbitrary value entered through issue filter form). Of course other relational operators could be included also.
