Description Hey Team, Okay, so I would like the ability to, in the Custom Fields, add a text field, or list, and have the ability to add additional fields/values through the UI. I'm not sure I'm explaining this correctly, but just as the "Add Another File()" option is there for Files section. I'd like to have Add Another Field() option to my Custom Field. Does that make sense?

So this would act like adding a category does? You have a list of items and you can just append to it a new item?

Hi Brett,

Thanks for the reply. Yes, similar to a category, yet be more flexible as a custom field. ie: apply to all projects, have different types, etc.

For a little background, I'm interested in integrating the issue tracking with a test script type of scenario. ie, I will have issues that are separate test scrips within a project. Each issue will be a separate test case and I want a custom field that I can expand to describe each step. I will be able to Close-Success or Close-Fail each issue and track them related to a project. I've created a new Tracker called Test Script.
