Description

Right now, to use Redmine.pm, both repository and Redmine project identifier must be same.
However, there is a case that both identifier/name are different.
To make it work, attached file is the changes I made to Redmine.pm on Redmine2.3.1.

Simply, I added a RedmineProjectId field to define the redmine project id.
If this field is written in configuration file, use it for $project_id.

```
...
    RedmineDSN "DBI:mysql:database=databasename;host=my.db.server"
    RedmineDbUser "redmine"
    RedmineDbPass "password"
    RedmineProjectId "redmine_project_id"
...
```

Since I'm not a perl programmer, I don't know how to write a nice code...

If this kind of specification could be added to trunk, it would be helpful.
Thanks.
