Target version:		Affected version:	2.3.2
Resolution:			
Description Hi, Monitoring the Redmine MySQL queries from Redmine app I found a lot of queries on table roles. For each member in project is executed a query below (changed the member_id) when I access the page "redmine/issues/xxxx": <pre>SELECT `roles`.* FROM `roles` INNER JOIN `member_roles` ON `roles`.`id` = `member_roles`.`role_id` WHERE `member_roles`.`member_id` = 2310</pre> The problem is that there are about 500 members in the issue project. It's possible to otimize this process? Thanks.

Hi,

I found the "problem". I have selected the option "Allow issue assignment to groups".
After unselected this, the excessive queries was finished.

Thanks.

This problem also occurs when you have a custom field with *user* format.
