Description Hello, As we click on "All issues" on projects page (New project View all issues Overall spent time Overall activity) URL seen is : http://myURL/redmine/issues I save a query with filters as (Issue is Open and Project = All my projects) with name as "Open Issues from all my projects" The URL is seen as http://myURL/redmine/issues?query_Id= 1; I see an issue list from all my projects (Pr1, Pr2 etc) But as I open one of the issue from Pr1, the query turns specific to Pr1, clicking on the Custom query, shows open issues from Pr1 only. This happens because, ?query_Id = "some_id" is appended to the URL. The URL is now http://myURL/redmine/pr1/issues?query_Id= 1; and not the one I created as http://myURL/redmine/issues?query_Id= 1; This goes against my thinking when I created the query, as I am not viewing Issues from All My Projects now. Is there any way to avoid the confusion ? I would suggest: create a separator : All Project Queries bellow : (Public) Custom Queries.
