Description

It would be really helpful if Wiki pages would also be available in PDF format, not only in HTML or TXT.
Imagine you have a nice documentation or specification in your internal Wiki and would like to send it to somebody who has no access to your Wiki. For that, a PDF version of your Wiki page would come in very handy.
Since it is already implemented on some pages in Redmine, I think this should be no problem for the Wiki too.

For what it's worth, the component missing to output wiki pages as PDF is html->PDF. If we want to use rfpdf engine, we first need to parse HTML to produce an intermediate object that can be expanded in an rfpdf template.
