Description

Hi:

I am trying to find a method to allow priority of issues to be updated automatically where status is changed from Review to Backlog. The reason being that I would like my development team to be able to see bug-fix requests at a glance and deal with them first. So for example, we have four statuses for issues: backlog, WIP, review, done. WIP follows an iterative methodology so that when the issue arrives in Review for UAT purposes, and a bug is found it can be quickly and simply reverted back to the development team by updating the status, whilst a simultaneous and automatic update is made to the issue priority, for example, normal to high.

Thanks.

- Status changed from New to Needs feedback

I think you described about Backlog plugin.
Redmine core does not have Backlog feature.
