Target version:		Affected version:	
Resolution:	Invalid		
Description			
<p>Hey,</p> <p>I'm no expert with Ruby or Rails. I have been tasked with moving our installation of red mine from one server to another.</p> <p>Initially I tired to just copy the site over and run the bundler but it didn't work.</p> <p>Not I have simple followed the instructions on the install page for the latest version, my thoughts being that if I could get a blank version working I could insert our data. (Maybe)</p> <p>The installation went okay. I have to change some perms and get the mysql_devel bits added but after that it seems to work however when I browse to the site I see the Apache test page.</p> <p>If I go to /public I see the following</p> <p>Not Found</p> <p>The requested URL /public/index.html was not found on this server.</p> <p>Can someone point me in the right directions, preferably in idiot steps.</p> <p>Thanks</p>
