Description			
I want to override the model method with my plugin. I tried to create a new model Patch with method that should override like this:			
<pre>require_dependency 'issue' module IssuePatch def self.included(base) # :nodoc: base.send(:extend, ClassMethods) base.send(:include, InstanceMethods) base.class_eval do alias_method :visible_condition, :visible_condition_with_patch end end module ClassMethods end module InstanceMethods def visible_condition_with_patch(user, options={}) <Do Something> end end end Rails.configuration.to_prepare do unless Issue.included_modules.include? IssuePatch # Issue.extend(InstanceMethods) Issue.send(:include, IssuePatch) end end</pre>
