Developing and maintaining a wiki page I often would like to add some hidden commentary which does not show in formatted view.

I think there is no way to do this at the moment. Code for Textile Comments is filtered and does not work.

Disfunctional Textile examples:

`{{collapse(comment block)}`

```text
###. This is a textile comment block.
``` 

`}}`

`{{collapse(multi-line comment block)}`

```text
###.. *
**
**
****************

- This multi-line comment
- will keep going and going
- even if you put blank lines in.****************
``` 

`}}`

`{{collapse(commented out block)}`

Here is some text with a <!-- Commented out --> block.

<!-- Here is a single <span>line</span> comment block -->

<!-- Here is a whole <span>multiline HTML</span> Comment -->

Normal text continues here.

`}}`

I know there is a plugin for this. I hope it will be made a core functionality soon. Cheers!

I stumbled across the same issue today, and wondered what I was doing wrong.

This marks Textile as not fully supported by Redmine for me (contrarily to what is written here: Wiki formatting > Text formatting).

Is Textile going to be abandoned in favor of Markdown ? I guess this issue would then be obsolete...

CommonMark Markdown (#32424) that is going to be introduced in Redmine 5.0.0 supports HTML comments. I think it would be nice if Textile supports HTML comments as well.

The following code adds HTML comments support to the Textile formatter.

```diff
index 2816e1c90..274f9cef8 100644

Here is a patch.

HTML comments in Textile are escaped since r1403. This patch may appear to roll back that change, but I think it is not a problem. This is because the purpose of the change is to prevent mistakenly entered unclosed comments from affecting page rendering (see #1160) and unclosed comments are still escaped even after applying the patch. It is ensured by the test source:trunk/test/helpers/application_helper_test.rb@21440#L1304.

Setting the target version to 5.0.0.

Committed the patch.
