Target version:			
Description			
<p>It's very helpful that estimated hours aren't lost any more for parent issues, but we have the following workflow, which is still unsupported:</p> <ul style="list-style-type: none">• When first estimating a project, we create issues for large tasks and roughly estimate those features• Before they're actually implemented, the task is broken down into subtasks, which allows for a more detailed estimation• If the original feature (e.g. parent task) was estimated correctly, the subtasks' estimated hours should sum up to roughly equal the parents' estimated hours <p>Currently, parent tasks' estimated hours are included into the total estimated hours. I've created an <code>is_quota</code> field for issues. If this is set to true, the parent's total estimated hours don't include the estimated hours of the parent itself, like so.</p> <p>For example, when the parent task has an estimate of 100.0 h, with one task having 25 h, the output looks like this:</p> <p>Estimated time: 100.00 h (Subtasks: 25.00 h)</p> <p>Any thoughts on this? Is the naming correct, or does anyone have a better idea? Is the formatting okay? The sum of the subtasks could also go below the parent's estimated time.</p> <p>I'll add tests for the feature once it's clear that everyone's happy and that the patch will actually be applied.</p> <p>Diff on GitHub</p>
