Description

Please change the #1561 implementation so that FieldFormat class determines if the custom field is totalable or not.

e.g.

```
class QueryCustomFieldColumn < QueryColumn

  def initialize(custom_field)
    self.name = "cf_#{custom_field.id}".to_sym
    self.sortable = custom_field.order_statement || false
    self.groupable = custom_field.group_statement || false
    self.totalable = custom_field.totalable
    @inline = true
    @cf = custom_field
  end
end
```

We have a plugin adding custom fields with field_format different than int and float and would like to use totalable feature for those custom fields.
