Description

I'm trying to create a fully software documentation on Redmine's Wiki, and just realised one limitation on Wiki's implementation.

It would be nice if Redmine's Wiki put on the URL the full path of a Page, something like:

```
/wiki/Development/Configurations/Enviroment
/wiki/Development/Configurations/Server
/wiki/Development/Standards
```

This feature is important because is very hard solve the name conflicts when you are creating new pages. If you want to create tow pages "Standards", one to developers and other to designers, it is not possible now. You have to hack with use of '-'

```
wiki/Developers/CompanyStandards
wiki/Designers/CompanyStandards
wiki/Developers-CompanyStandards
wiki/Designers-CompanyStandards
```

Other point is that if the url show the hierarchy, it would be easy to understand the information architecture of text.
