

Redmine - Feature #22601

Add ability not to emit "update emails" when doing mass-update of tickets

Description

Sometimes I need to do some large ticket-maintenance tasks, like moving bunch of tickets from one project to another, or so. It works great, but it has some disadvantage - every time I do this, all my colleagues are flooded by large wave of emails (ticket updates), because they are watchers. It would be nice to send just one email, but I guess this will be not so simply, because there are different watchers in different tickets, so it can't be solved by just one email. But one feature can help - to have ability to "[x] Disable e-mail notifications for this mass update" - so just one checkbox in form for editing multiple tickets at once, which will disable email emitting for current mass-edit.

i work around this as admin by turning off notifications for a second lol or doing things through the db.
