

Redmine - Feature #2271

base href for passenger sub-URI deployment

<b>Resolution:</b>			
<b>Description</b> The usefulness of this feature arises in the following <b>scenario</b> : You deploy redmine using <a href="#">mod_rails a.k.a. Phusion Passenger's sub-URI method</a> , but the sub-URI is a moving target. This is certainly possible. You deploy Redmine somewhere and then decide you want to change the URL.  Problem: But that breaks relative links in your wiki pages and elsewhere!  Solution: add a configuration setting called "sub-URI" to <a href="#">Administration-&gt;Settings-&gt;General</a> , right after the setting named "Host name". If set, write this value as <base href='.....' /> inside <head> of <a href="#">app/views/layouts/base.rhtml</a>  That way, when the administrator moves Redmine around under the web document root, he only needs to change the sub-URI setting and hyperlinks will work. This feature would increase Redmine's flexibility, make it more "portable", and make it easier to deploy using <a href="#">Passenger</a> .

I'm not sure but I think this is already possible. Someone more information about this feature?
