

Redmine - Feature #2271

base href for passenger sub-URI deployment

2008-12-03 19:22 - Keith Cascio

Description	
<p>The usefulness of this feature arises in the following scenario: You deploy redmine using mod_rails a.k.a. Phusion Passenger's sub-URI method, but the sub-URI is a moving target. This is certainly possible. You deploy Redmine somewhere and then decide you want to change the URL.</p> <p>Problem: But that breaks relative links in your wiki pages and elsewhere!</p> <p>Solution: add a configuration setting called "sub-URI" to Administration->Settings->General, right after the setting named "Host name". If set, write this value as <code><base href='.....' /></code> inside <code><head></code> of app/views/layouts/base.rhtml</p> <p>That way, when the administrator moves Redmine around under the web document root, he only needs to change the sub-URI setting and hyperlinks will work. This feature would increase Redmine's flexibility, make it more "portable", and make it easier to deploy using Passenger.</p>

I'm not sure but I think this is already possible. Someone more information about this feature?
