Description

In other words, once the macro call executes it replaces itself with the contents of the referenced wiki page.

Our use case is an "automated tickets" setup for reoccurring tasks. Using the current include macro for this works well enough, but if want to modify the original description in any way we end up with the include macro call + any new content. If we want to strike out items in the list from the original page we're unable to (easily) do so.

Thank you for our consideration.
