Redmine - Feature #22959

Customize "Related issues" list in version detail

Description

When we look at the details of a version, there is this Related issues list:

But this is always formatted the same way (Issue ID, Issue subject).
What about being able to select the fields we want displayed, the same way we do for the issue list:

Options

Columns

Available Columns		Selected Columns
Parent task		Subject
Author		Project
Updated		Tracker
Category		Status
Start date	→	Priority
Due date	←	Assignee
Estimated time		Target version
Spent time		% Done
Overall spent time		Total estimated time
Created		

Group results by: **Priority** ▼

Show: ☐ Description

Totals: ☑ Estimated time ☑ Spent time

This could be done either per version, per project or per installation.

Related issues:

I think you can set filter with version in issue list.

#2 - 2016-06-06 15:27 - Joel SCHAAL

Thanks Haihan Ji for your reply.

That is something we do, but it implies an extra step each time we create a version (setting up a query with the desired result, and put it in the wiki of the version) and more importantly, each time we access a version: in the Roadmap view, you still have the regular list of issues under the version. To see the results like we want, we have to click on that link first.

So I consider this more like a workaround.

If we bring up all functionality that Issue query page has - essentially having a page for version is lost! The version page lists various other details (related to project management aspects etc.) which is why that page is not merely a view that comes from issue query page.

However, I do agree that unlike current simple listing - we must have more meaningful grouping of issues. For example, child issues can be readily shown as tree structure. Similarly, the sorting can be based on issues which preceds others etc.
Similarly grouping can be done based on priorities or various approval statuses or other such attributes. That would really help.

I think it is pointless to recreate the entire functionality of issue query page. Hence I propose that in the project page we should be able to provide a full fledged query type interface under "settings" which will allow the team to customize how project page would look like and it will be like a hidden stored query. Then all version pages (and roadmap pages) can have the neat customized view without having any filters there.
