| Description For projects with lots of users it may be time-consuming to find assignees in dropdown lists. It would be nice to add a text filter to such fields that would allow to enter some characters of the user's name and display only users whose names match it. Probably something like this: http://www.listjs.com/examples/fuzzy-search | | | |

This functionality already exists to add watchers. Should be easy to also apply to assignee?

- 1. Filter implemented in 'Watchers' uses AJAX requests to fetch filtered results which is kinda slow. The one in example filters values on the client side which is much faster.
- 2. The 'Watchers' filter is ugly and clumsy. There already are dropdown lists for users in the UI, we should use them.
- 3. This is needed not for assignee only, but for every field with type = 'user'

Found a much better soultion than the one I initially proposed: <https://github.com/selectize/selectize.js>
See demos section: <http://selectize.github.io/selectize.js/>
