Description Very usefull, for example we have trackers <i>Customers</i> and <i>Contact Persons</i> and we're using parent/child for interlinking. When implemented, we can set, for example, that there will be displayed phone and email custom fields on the parent issue view. Currenty, don't have idea, where is the best way to configure. In custom field definition (will be limited just to custom fields, not the build-in ones)? Any other place?
